

LET'S MAKE YOUR ENVIRONMENT SAFER

In-Building Public Safety Communication Systems are needed... Radio signals have limited propagation through various materials.

Today's first responders not only rely on dependable voice communication, but increasingly also on data, telemetry, and location information. In an emergency situation where a matter of seconds can mean the difference between life or death, every tool at the first responder's disposal must be absolutely reliable.

SAFER BUILDING COALITION

In addition to safety, having reliable coverage is a solid investment which could improve property class ratings and reduce insurance costs. If you have an existing facility we will be able to assess your current coverage and provide you with an improvement plan. For buildings that are in planning phase, Telnet can provide a pre-construction plan to ensure first responder communications into the building architecture and regulatory compliance for your occupancy permit.
